# Creating fancy letterheaded paper

Previous

Overview: Styling boxes

Next

If you want to make the right impression, writing a letter on nice letterheaded paper can be a really good start. In this assessment we'll challenge you to create an online template to achieve such a look.

**Prerequisites:** Before attempting this assessment you should have already worked through all the articles in this module.

**Objective:** To test comprehension of CSS box model, and other box-related features such as implementing backgrounds.

---

## Starting point

To get this assessment started, you should:

- Make local copies of the `HTML` and `CSS` — save them as `index.html` and `style.css` in a new directory.

- Save local copies of the `top`, `bottom` and `logo` images in the same directory as your code files.

**Note:** Alternatively, you could use a site like `JSBin` or `Thimble` to do your assessment. You could paste the HTML and fill in the CSS into one of these online editors. If the online editor you are using doesn't have a separate CSS panel, feel free to put it in a `<style>` element in the head of the document.

---

## Project brief [🔗](#)

You have been given the files needed to create a letterheaded paper template. You just need to put the files together. To get there, you need to:

### The main letter [🔗](#)

- Apply the CSS to the HTML.
- Add a background declaration to the letter that:
  - Fixes the top image to the top of the letter
  - Fixes the bottom image to the bottom of the letter
  - Adds a semi-transparent gradient over the top of both of the previous backgrounds that gives the letter a bit of texture. Make it slightly dark right near the top and bottom, but completely transparent for a large part of the center.
- Add another background declaration that just adds the top image to the top of the letter, as a fallback for browsers that don't support the previous declaration.
- Add a white background color to the letter.
- Add a 1mm top and bottom solid border to the letter, in a color that is inkeeping with the rest of the color scheme.

### The logo [🔗](#)

- To the `<h1>`, add the logo as a background image.
- Add a filter to the logo to give it a subtle drop shadow.

- Now comment out the filter and implement the drop shadow in a different (slightly more cross-browser compatible) way, which still follows the shape of the round image.
- 

## Hints and tips [🔗](#)

- Remember that you can create a fallback for older browsers by putting the fallback version of a declaration first, followed by the version that works across newer browsers only. Older browsers will apply the first declaration and ignore the second one, whereas newer browsers will apply the first one, then override it with the second one.
  - Feel free to create your own graphics for the assessment if you wish.
- 

## Example [🔗](#)

The following screenshot shows an example of what the finished design could look like:

*The Awesome Company*

*102-112 Frail Bend Bridge  
The Dwindlings  
Little Hornet  
HX3 9ZQ  
UK*

If you are following this assessment as part of an organized course, you should be able to give your work to your teacher/mentor for marking. If you are self-learning, then you can get the marking guide fairly easily by asking on the [discussion thread](#) for this exercise, or in the [#mdn IRC channel](#) on [Mozilla IRC](#). Try the exercise first — there is nothing to be gained by cheating!
